Abstract – Now a day's people are facing further problems about road accident in all over world, currently accident is the most essential issue far and wide in the world; utmost of accident are due to rush driving of vehicle by motorist on public road indeed in confined areas. In recent study million of people failed in India due to road accident. Main reason of road accident is people one who driving vehicle veritably presto, drive vehicle by drinking alcohol, some people doesn't use Seatbelt, frazzle of motorist. Hence business operation is important in big megacity. Then in this paper, trying to reproduce the comprehensive literature study related to the colorful vehicle speed control fashion, accident discovery that are necessary to reduce accident to save precious life of one. In once days, the exploration is gone on colorful vehicle speed control fashion like traditional automotive mechanical system systems. Due to the advancement in recent ways, some vehicle speed control systems are grounded on microcontroller, GSM, GPS, numerous different detector like alcohol discovery, close eye discovery, RFID, Sigsbee, Wi-Fi, CAN machine protocol and radio frequencies system, etc. Each system has their own advantages and disadvantages. In utmost of systems, SMS fashion is used for communication so the system will come cost effective, more dependable and it'll take lower time to deliver communication. As accident becomes major problem currently, the speed covering systems moment needs to make use of the rearmost technology. In some papers, the authors have presented different vehicle speed monitoring system is bedded in vehicle or on road to control speed of vehicle automatically. Occasionally system will check whether condition like motorist frazzle, alcohol discovery, seat belt etc. Also the enhanced security systems are

available grounded on android platform, wireless ways and bedded systems. A number of modifications take places in colorful vehicle speed control fashion from the last many times, in coming coming times numerous changes will takes place.

Keywords: Vehicle speed, GSM, GPS, Wi-Fi, CAN

I. INTRODUCTION

Speed control of vehicle is need of hours due to increase in accident in our day to day life. People are driving veritably presto, hence accident passed constantly and we've to lose our precious life. mortal error is also causes utmost of road accident Hence for help this accident motorist should warn about the speed of vehicle. To break this problem related to accident Main end of this paper is to control speed of vehicle automatically in confined areas similar as academy zone, demesne, Hospital. Now days colorful placard are place on road but numerous time motorist ignore this placard and drive vehicle at unhappy speed and beget for accident. Some intelligent motorist system bear to control the different parameter of vehicle similar as speed of vehicle, position of vehicle also it should cover the motorist geste like heart beat, alcohol, discovery, eye blink etc. Different detector are use to cover theses parameter. For vehicle shadowing GPS system is used for chancing position of vehicle.

II. LITERATURE SURVEY

Vehicle Speed Control systems are categorized based on technology 1) GSM based, 2) GPS based, 3) Radio Frequency based, 4) RFID based, 5) Wi-Fi based, 5)) Motion detector based, 6) Zigbee based, 7) Advance speed advisory system based, 8) Microcontroller based, 9) Motion detector based,10)Biometry sensor 11) Color Sensor based Combined system.

1. GSM AND GPS BASED SYSTEMS :

To know the position of vehicle, speed, exertion of motorist(1) achieve the real time information of vehicle. GSM and GPS system allow object shadowing. For Accident forestallment we should know geste of motorist(2) or condition of motorist similar as eye blink, drunk situation different detector are use. In GSM and GPS system if accident passed any where accident information will actuated and message is transmitted to third party(3). GPS system use for tracking vehicle and give global position of vehicle this information is passed to GSM modem. Because of GPS system it give secure travelling, GSM is used for communication purpose GSM module which gets actuated by a regulator GSM digitalize data and shoot message to authority to apprehensive. If GSM system is place in auto we can communicate automatically to thirdparty.In ultramodern road monitoring system to control movement of vehicle over entire transport network for safe operation using GSM- road radio communication(25). In order to make sure that injured person delivering, for that purpose delivering commerce information system is developed.

discovery. In some system to collect business data in civic megacity use mobile detector (23). In network detector base system it enables to collect real time data of business in big metropolises. Speed detector observed speed of vehicle at regular interval (22). For collision discovery, used camera to cover image to suffer discovery process and distance computation.

2.1 Biometric Based System:

Numerous accident are passed due to geste Of driver .For that purpose nonstop assessment of different condition like alcohol, eye blink, frazzle, seatbelt, heart beat rate etc. In vibration detector system detector are use to descry vibration if climate increases above certain limit it indicate abnormal condition(3). These different sensors spark microcontroller and messages shoot to affiliated authority like police station, sanitarium by using GSM system, Massage contain all information about position, number plate of vehicle. numerous accident are passed due to motorist fatigue, detector base system can anatomized eye movement of motorist(22).

Fig.3. Eye blink detector

Fig. 2: diagram of Vehicle tracking [3]

2. Sensor Based Detector based system:

Different detector are use to descry different condition like handicap discovery, speed discovery, alcohol discovery, eye blink detection, motorist heart beat

2.2 Color Sensor Based Detector system:

In color detector system(5) different color strip painted on the road, trace, color detector sensor descry color strip which is painted on road and limit speed of vehicle at particular limit. Color detector sensor are located below cushion lattice of vehicle which can descry the color of color strip painted on trace and spark system by transferring signal to MCU, MCU control position of throttle stopcock to control speed of machine to given limit(4). Programmable MCU can reuse signal from different element and shoot to garrote stopcock, speedometer, vehicle. In this way we can control speed of vehicle using color detector approach

business inflow on road use intelligent business light system which use customer garçon communication that an give the information about direction and speed of vehicle(24).

7. ZIGBEE Grounded SYSTEMS

Vehicle speed information is transmitted using Zigbee system which is wireless mode of communication, which activated by rush driving(31). It salutary at exigency condition(30), it proves as effective. It correspond of two corridor transmitter and receiver transmitter is place at predetermine road. Information is shoot using wireless Zigbeemodel(17). In addition to this business lights status collected by the transmission units will be transmitted via ZigBee(29). ZigBee wireless technology is considered as a largely promising seeker for intra-vehicular wireless networks(28). This system is also useful for business operation(31). This model experimented for six zone(i) School zone(ii) Hospital Zone(iii) Steep Angles Ahead(iv) Bridge Works Ahead(v) Hair Leg Bend Ahead(vi) Accident Prone Area Ahead. Receiver containing Zigbee, Microcontroller, CAN regulator. entered signal by Zigbee and shoot to microcontroller and also it shoot to CAN regulator. Speed information is attained from speedometer through CAN regulator. CAN machine protocol is enforced using a single board computer(SBC) and penetrated the vehicle parameters ever(27).

Fig 7: Block Diagram of transmitter section[17].

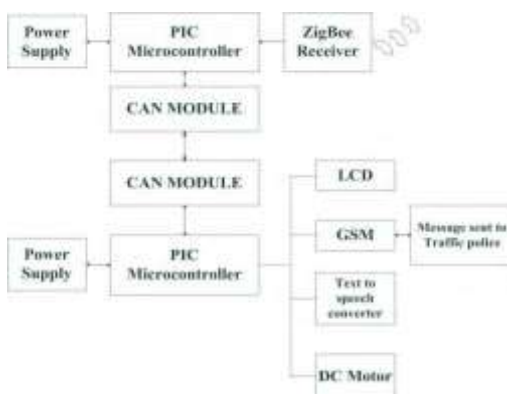

Fig 8: Block Diagram of Receiver section [17].

8. WI- FI BASED SYSTEMS

Intelligent Transportation system is advance system to minimize accident. This System focus on use of Global positioning system using bedded wireless Fidelity this is new approach for intelligent vehicle control(18). In propose work system tackle can cover signal using GPS if there's normal state speed is normal else signal shoot to ARM processor to reduce speed of vehicle at certain limit. ARM processor collect data from GPS and it shoot to Device motorist for operate vehicle at safe limit.

9. ADVANCE motorist ASSISTANT SYSTEMS

At present vehicles, auto, truck are drive by mortal but in unborn vehicle will be drive by robot, they can descry handicap on the way, speed of vehicle, zone of where speed limitation, accident prone area, stop sign, position of road. In ADAS it's set of system to help motorist for stay in comfort(19). This system correspond of three mainsub-system i) motorist, ii) Road side terrain, iii) Vehicle. In propose work to increase or drop speed of vehicle PWM fashion is use.

III. DISCUSSION

From all study we got knowledge about each different wireless technology for controlling speed of vehicle. Because vehicle speed control is important issue for like academy zone, sanitarium zones, hilly areas, accident zones, rambler crossing and so on. Different technology use for control speed of vehicle without convenience the motorist, we can get automatically control on vehicle. For this purpose we can use different technologies similar as RFID, GPS, GSM, Zigbee, RF Module, different microcontrollers. Each Technology has its own operation and downsides like range, circuitry, cost, operation, complexity, power demand, data rate etc. relative analysis of different wireless technology which used in vehicle speed control(34)

1. Infrared – It allow to communicate at short range. Data can shoot bidirectional.
2. Wireless Fidelity(Wi- Fi) – Wi- Fi relate to as IEEE802.11 communication standard for wireless original area network(WLANs). Different Security styles available from unauthorized access.

3. Zigbee – Zigbee is suite of specification for high positioncommunication.Zigbee network use to transmit data over larger distance.

Table 1 lately Proposed Different Vehicle speed control Systems using colorful ways and their comparison(35)-(36

Specification	RFID	IR Wireless	Wi-Fi (802.11)	Zigbee
Power Consumption	Medium	low	High	Very Low
Security	64 and 128 bit encryption			128 AES plus application layer security
Typical Applications	Tracking items	Remote control, PC, PDA, Laptop	WLAN connectivity, Broadband Internet access	Industrial control and monitoring, Sensor networks, building automation, Home control and automation
Complexity	Low	Low	High	Low
Data Rate	varies	20-40Kbits/sec	11 and 54 Mbps	20, 40 and 250 Kbps
Range	3 meters	<10 meter line of sight	50-100 meters	10-100 meters
Operating frequency	varies	800 -900 nm	2.4 and 5 GHz	2.4 GHz

IV-CONCLUSION

From all we conclude that different wireless technology are used in vehicle speed control as per operation. Then some sensor are used for alcohol discovery, closed eyes, crash discovery, automatic discovery of zone like sanitarium zone for automatic disable cornucopia, academy zone academy zone, hills area, and roadways. This innovative fashion was developed substantially in

a motive of reducing the death rates that are lost during accidents. This Survey Paper creates a satisfactory result for the long lasted problem.

ACKNOWLEDGMENT

Acknowledgment to person or the organization supported to the author for the research work. This is not mandatory for all.
